

CARELINK 1.0 — User & Handoff Guide

Independent clinical care coordination application.

Start

- Install Python 3.12+ and run `pip install -e '\.[dev]'`.
- Copy `.env.example` to `.env`.
- Run `python -m app.database.init_db --demo` for a ready demo, or initialize tables and create the first administrator from the browser.
- Run `uvicorn app.main:app --reload`.
- Open `http://127.0.0.1:8000/`.

Demo accounts

admin / Admin123! · doctor / Doctor123! · nurse / Nurse123! · lab / Lab12345!

Workflow

Foundation → Patient → Admission → Vitals/Medication → Investigations → Doctor Review/Orders → Handover → Alerts → Discharge.

Security

Passwords use script hashing and API access uses short-lived signed bearer tokens. Configure `CARELINK_SECRET_KEY` and change demo credentials before shared use.

Deployment boundary

This is a working development/demo clinical information system, not a certified medical device. Real clinical deployment requires formal clinical governance, privacy/security review, migrations, backups, monitoring, TLS, and applicable regulatory review.
